To avoid abandonment of this application, applicant must timely file one of the following replies: (1) an amendment, affidavit, or other evidence, which places the application in condition for allowance; (2) a Notice of Appeal (with appeal fee) in compliance with 37 CFR 41.31; or (3) a Request for Continued Examination (RCE) in compliance with 37 CFR 1.114. The reply must be filed within one of the following time periods:</p> <p>a) <input checked="" type="checkbox"/> The period for reply expires <u>3</u> months from the mailing date of the final rejection.</p> <p>b) <input type="checkbox"/> The period for reply expires on: (1) the mailing date of this Advisory Action, or (2) the date set forth in the final rejection, whichever is later. Continuation of 11. does NOT place the application in condition for allowance because: the arguments presented are not persuasive.

The Applicant argues that the 12b waveform of Hoshi is merely the output of the signal selection circuit and not the memory circuit.

While true, the 12b waveform is output by the signal selection circuit of Hoshi, this is not seen as dispositive. To further explain, the signal selection circuit of Hoshi can be broadly read as part of a digital memory circuit which includes said selection circuit and the memory cell. As the Applicant has not specifically limited what is included in the claimed memory circuit, such a term is seen as being capable of being read to reasonably include both the memory cell and selection circuit of Hoshi.

Additionally, it should be noted that Hoshi is merely a secondary reference. The Parks reference provides the majority of the structure of the pixel circuit. Parks, however, does not disclose providing an AC voltage to the opposite electrode or that that AC voltage has the same amplitude as the voltage supplied to the pixel electrode by the memory circuit.

Hoshi teaches applying a voltage with the set amplitude to the pixel electrode and an AC voltage with the same amplitude to the opposite electrode. It is this teaching of Hoshi that is combined with Parks. Combining this teaching by Hoshi into Parks will result in Parks merely setting an AC voltage supplied to the opposite electrode equal to the voltages supplied by the memory circuit.

As such the rejections are seen as proper and are thus maintained..
